

Week 1 - 2 Cycle 1

In this first Scrum Cycle we focused on creating the initial structure of the project as well as getting everyone initialized and ready to work on the features of the project. First we used Next.js to start our project template and get the layout of our web project. We integrated mapbox as a component into using the Mapbox api. We created a schema for the building and event data inside a TypeScript interface. We set up Supabase in order to enable users to sign in using google on through our webpage. We then updated the git hub and got everyone to be able to run the project as well as created our own branches for next week's development cycle.
